Equilibrium is stable if $Q > 0$
unstable if $Q < 0$

Stable vs. unstable equilibrium

3

- Two cases:
- (i) $\vec{F}_{Q2} \leftarrow \bullet \rightarrow \vec{F}_{Q1}$ (repulsion by z_1, z_2)
 - (ii) $\leftarrow \bullet \rightarrow$ (attraction by z_1, z_2)
 $\vec{F}_{Q1} \quad \vec{F}_{Q2}$

In both cases, $|\vec{F}_{Q1}| = |\vec{F}_{Q2}| \equiv F_{\text{equilibrium}}$ at equilibrium position

① Suppose Q is moved to the right relative to equilibrium

Then:

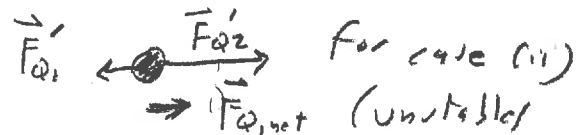

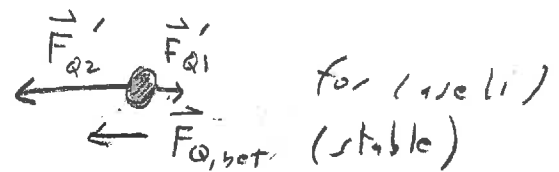

$$x \rightarrow x + \epsilon \equiv x'$$

$$y \rightarrow y - \epsilon \equiv y'$$

$$F_{Q1} \rightarrow F'_{Q1} = \frac{k|Q||z_1|}{(x+\epsilon)^2} < F_{\text{equilibrium}}$$

$$F_{Q2} \rightarrow F'_{Q2} = \frac{k|Q||z_2|}{(y-\epsilon)^2} > F_{\text{equilibrium}}$$

Thus, $\vec{F}_{Q, \text{net}} = \vec{F}'_{Q1} + \vec{F}'_{Q2}$

② Similarly, if Q is moved to the left

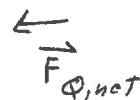

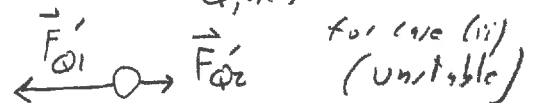

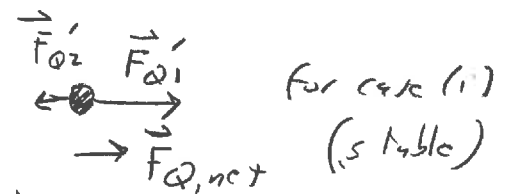

Then

$$x \rightarrow x - \epsilon \equiv x'$$

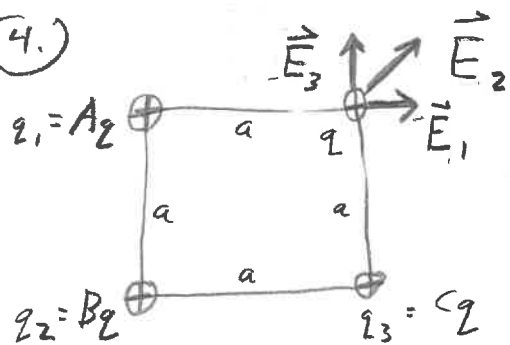

$$y \rightarrow y + \epsilon \equiv y'$$

$$F_{Q1} \rightarrow F'_{Q1} > F_{\text{equilibrium}}$$

$$F_{Q2} \rightarrow F'_{Q2} < F_{\text{equilibrium}}$$

$$(A=4, B=4, C=8)$$

a) Electric Field at q :

$$\vec{E}_{tot} = \vec{E}_1 + \vec{E}_2 + \vec{E}_3$$

$$= \frac{k A q}{a^2} \hat{x} + \frac{k B q}{(\sqrt{2} a)^2} (\cos \theta \hat{x} + \sin \theta \hat{y}) + \frac{k C q}{a^2} \hat{y} \quad (\text{where } \theta = 45^\circ)$$

$$\vec{E}_{tot} = \frac{k q}{a^2} \left[A \hat{x} + \frac{B}{2} (\cos \theta \hat{x} + \sin \theta \hat{y}) + C \hat{y} \right]$$

$$= \frac{k q}{a^2} \left[A \hat{x} + \frac{B \sqrt{2}}{4} (\hat{x} + \hat{y}) + C \hat{y} \right]$$

$$\begin{aligned} \cos 45^\circ &= \sin 45^\circ \\ &= \frac{\sqrt{2}}{2} \end{aligned}$$

$$= \frac{k q}{a^2} \left[\left(A + \frac{B \sqrt{2}}{4} \right) \hat{x} + \left(C + \frac{B \sqrt{2}}{4} \right) \hat{y} \right]$$

b) Electric force on q :

A diagram of a two-cell embryo. It consists of two rounded cells. The upper cell is labeled '22' and has a small circle at its top with several lines radiating upwards, representing the apical pole. The lower cell is labeled '21' and has a small circle at its bottom with several lines radiating downwards, representing the basal pole. Arrows on the sides of the cells indicate a lateral flow or interaction between them.

⑦

q_1 is negative, since field lines terminate on q_1 .

Number of field lines surrounding $\begin{matrix} 22 \\ 21 \end{matrix} = \begin{matrix} 18 \\ 6 \end{matrix}$

~~3~~

Magnitude of electric field is proportional to density of field lines passing thru a surface, so number/area.

For the same area of a sphere ($A = 4\pi R^2$)
 centred at q_1 and then at q_2
 we have 3x as many lines, for q_2 than
 for q_1 .

→ $q_2 = 3q_1$

$$\Delta y = 0.0055 \text{ m} = \boxed{5.5 \text{ mm}}$$

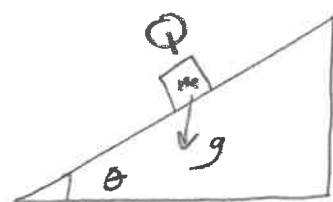

(c) $v_x = 3.80 \times 10^5 \text{ m/s}$ (since \vec{F} is in the y-direction)

$$v_y = a \Delta t = \left(\frac{qE}{m} \right) \Delta t$$

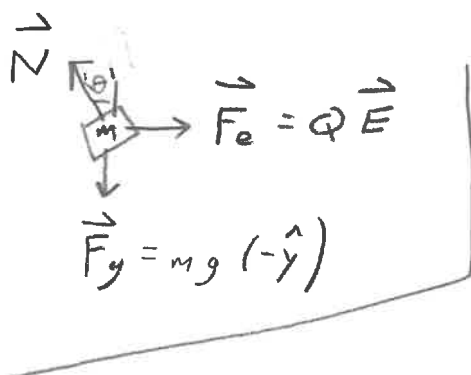

$$= 9.32 \times 10^4 \text{ m/s}$$

Thus, $\boxed{\vec{v} = 3.80 \times 10^5 \text{ m/s} \hat{x} + 9.32 \times 10^4 \text{ m/s} \hat{y}}$

a) In order for m to be at rest, $\vec{F}_{\text{net}} = \vec{0}$,

$$\text{Thus, } \vec{0} = \vec{F}_g + \vec{F}_e + \vec{N}$$

$$= -mg \hat{y} + QE \hat{x}$$

$$+ N \cos \theta \hat{y} - N \sin \theta \hat{x}$$

$$= (QE - N \sin \theta) \hat{x}$$

$$+ (N \cos \theta - mg) \hat{y}$$

This implies:

$$QE - N \sin \theta = 0 \rightarrow E = \frac{N \sin \theta}{Q}$$

$$N \cos \theta - mg = 0 \rightarrow N = \frac{mg}{\cos \theta}$$

$$\left. \begin{array}{l} E = \frac{N \sin \theta}{Q} \\ N = \frac{mg}{\cos \theta} \end{array} \right\} \boxed{E = \frac{mg \tan \theta}{Q}}$$

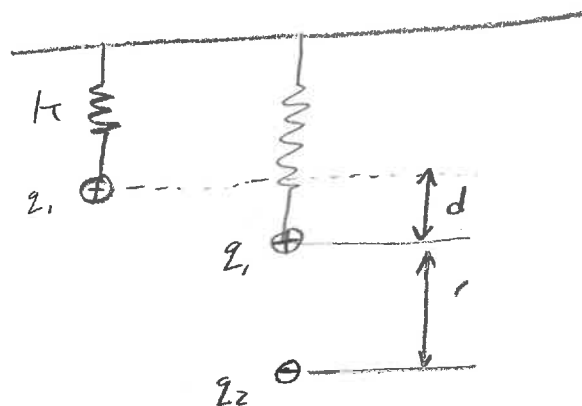

b) For He $m = 5.06 \text{ g} = 5.06 \times 10^{-3} \text{ kg}$, $q = -7.56 \mu\text{C}$, $\theta = 24.9^\circ$ (9)
