Simple pendulum: ("Freshman physics")

Free-body diagram:

$N = mg \cos \phi$

$mg \sin \phi$

$m \ddot{\phi}$

$$\begin{cases} a_c = \frac{v^2}{r} = \omega^2 r \\ a_t = \alpha r \\ \alpha = \ddot{\phi}, \quad \omega = \dot{\phi} \end{cases}$$

$T = mg \cos \phi$

centripetal acceleration

$T - mg \cos \phi = m \ddot{\phi} l$

$T = m \dot{\phi}^2 l + mg \cos \phi$

$m g \sin \phi = -m \alpha_{tangential}$

$\ddot{\phi} = -\frac{g}{l} \sin \phi$  EoM

$$\ddot{\phi} = -\frac{g}{l} \sin \phi \quad (\text{hard to solve; } 2^{\text{nd}} \text{ order nonlinear ODE})$$

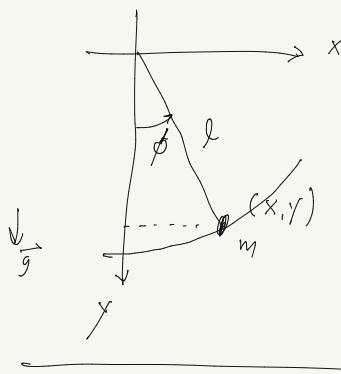

Small-angle approx:  $\phi \ll 1 \text{ rad} \approx 57^\circ$  ( $\pi \text{ radians} = 180^\circ$ )

$$\Rightarrow \ddot{\phi} = -\frac{g}{l} \phi \quad \omega_0 = \sqrt{\frac{g}{l}}$$

$$\begin{aligned}\phi(t) &= A e^{-i \sqrt{\frac{g}{l}} t} \\ &= c_1 \cos(\omega_0 t) + c_2 \sin(\omega_0 t) \\ &= a \cos(\omega_0 t + \alpha)\end{aligned}$$

Lagrangian formalism:

$$L = T - U$$

$$\begin{aligned}(x, y) &\quad x = r \cos \phi \\ (r, \phi) &\quad y = r \sin \phi \\ T &= \frac{1}{2} m(r^2 \dot{\phi}^2 + r^2 \dot{\phi}^2) = \frac{1}{2} m l^2 \dot{\phi}^2\end{aligned}$$

$$\begin{aligned}U &= -m g y \\ &= -m g l \cos \phi \\ T &= \frac{1}{2} m (x^2 + y^2) \\ &= \frac{1}{2} m l^2 \dot{\phi}^2 \\ L &= \frac{1}{2} m l^2 \dot{\phi}^2 + m g l \cos \phi\end{aligned}$$

FURTHER

Lagrange's equation

$$\begin{aligned}\frac{d}{dt} \left( \frac{\partial L}{\partial \dot{\phi}} \right) &= \frac{\partial L}{\partial \phi} \\ \frac{d}{dt} (m l^2 \dot{\phi}) &= -m g l \sin \phi \\ m l^2 \ddot{\phi} &= -m g l \sin \phi \\ \ddot{\phi} &= -\frac{g}{l} \sin \phi\end{aligned}$$

$L$  does not depend explicitly on time  $t \Rightarrow E$  is conserved.

$$E = \sum_i \frac{\partial L}{\partial \dot{q}_i} \dot{q}_i - L$$

$$= T + U$$

Example:

$$\boxed{E} = \frac{\partial L}{\partial \dot{\phi}} \phi - L$$

$$= ml^2 \dot{\phi} \dot{\phi} - \left( \frac{1}{2} ml^2 \dot{\phi}^2 + mgl \cos \phi \right)$$

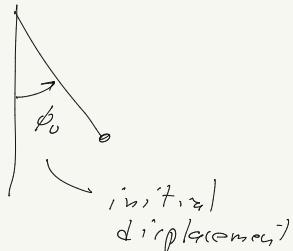

$$= \frac{1}{2} ml^2 \dot{\phi}^2 - mgl \cos \phi$$

$$= T + U$$

$$E = -mgl \cos \phi_0$$

$$-mgl \cos \phi = \frac{1}{2} l^2 \dot{\phi}^2 - mgl \cos \phi$$

$$\dot{\phi}^2 = \frac{2}{l^2} (mgl \cos \phi - mgl \cos \phi_0)$$

$$\dot{\phi}^2 = 2 \frac{g}{l} (\cos \phi - \cos \phi_0)$$

$$\frac{d\phi}{dt} = \dot{\phi} = \pm \sqrt{2} \frac{g}{l} \sqrt{\cos \phi - \cos \phi_0}$$
